## STAT 261, Lab 2

## HIV prevalence from WHO

- Estimated HIV prevalence was obtained from the gapminder website https://www.gapminder.org/data/
  - Estimated number of people living with HIV per 100 population of age group 15-49.
  - Original data source is the UNAIDS online database at http://www.aidsinfoonline.org
- A spreadsheet of the data, HIVprev.csv, is necessary for this lab.

We can read in these data as follows (we'll learn about reading in data later in STAT 260):

```
library(tidyverse) # you must have already installed the tidyverse package
## Warning: package 'tidyverse' was built under R version 4.0.2
## -- Attaching packages ------ tidyverse 1.3.0 --
## v ggplot2 3.3.2
                     v purrr
                               0.3.4

                   masks stats::lag()
hiv <- read.csv("HIVprev.csv", stringsAsFactors = FALSE)
hiv <- select(hiv,Country, year, prevalence)</pre>
Take a look at the top and bottom few lines of raw data.
head(hiv)
    Country year prevalence
## 1 Algeria 1990
                      0.06
## 2 Algeria 1991
                      0.06
## 3 Algeria 1992
                      0.06
## 4 Algeria 1993
                      0.06
## 5 Algeria 1994
                      0.06
## 6 Algeria 1995
                      0.06
tail(hiv)
        Country year prevalence
## 1601 Zimbabwe 1995
                          25.1
```

```
## 1602 Zimbabwe 1996 26.2

## 1603 Zimbabwe 1997 26.5

## 1604 Zimbabwe 1998 26.3

## 1605 Zimbabwe 1999 25.7

## 1606 Zimbabwe 2000 24.8
```

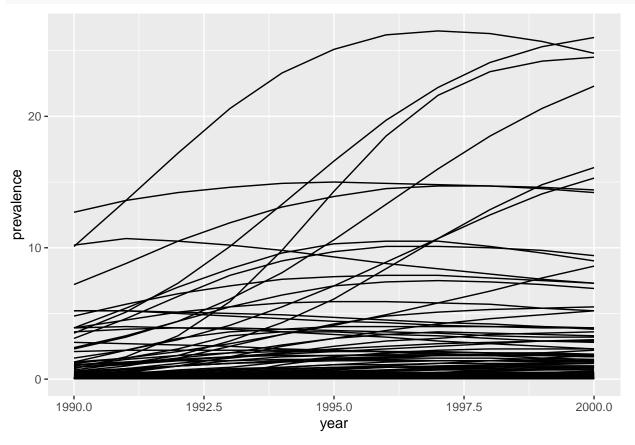

## Country year prevalence Length: 1606 :1990 : 0.060 ## Min. Min. Class :character 1st Qu.:1992 1st Qu.: 0.060 ## Mode :character Median:1995 Median : 0.200 ## ## Mean :1995 : 1.575 ## 3rd Qu.:1998 3rd Qu.: 1.100 :2000 :26.500 ## Max. Max.

## Exercises:

1. Plot time series of HIV prevalence by year for each country.

## Solution:

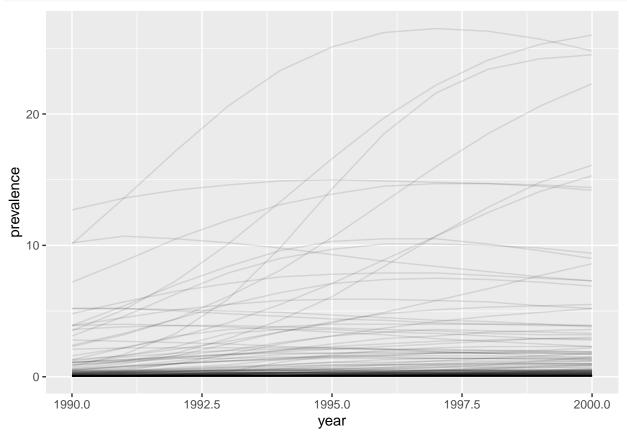

ggplot(hiv,aes(x=year,y=prevalence,group=Country)) + geom\_line()

2. Redo the above plot but experiment with different alpha values. What problem does setting a small alpha overcome? What feature of the graph is hidden when we do not set alpha?

Solution:

Due to many of the time series overlapping, we cannot observe that most coutries have an HIV prevalence of close to zero (i.e., there is overplotting). A small alpha value overcomes the overplotting and reveals the low HIV prevalence of most countries.

3. In the following code chunk we create a new dataset comprised of countries that had HIV prevalence greater than 10% in one or more of the years monitored (we will learn about this kind of "data wrangling" in future lectures of STAT 260).

Add red lines for the above countries to your time series plot.

Solution:

```
ggplot(hiv,aes(x=year,y=prevalence,group=Country)) + geom_line(alpha=.1) +
geom_line(data=hihiv,color="red")
```
